Analyzing Social Distancing Based on Sensory Inputs
Emmanuel Malyarovich, Kuhu Halder
Advisor: Murtadha Aldeer

System Implementation
- Using Yolo as a framework for object detection
- Yolo applies a single neural network to the full image and then divides the image into regions and predicts bounding boxes and probabilities for each region
- Thousands of images from the Department of Transportation in New York were run through the Yolo framework to produce a result
- Pedestrian images were analyzed and a count of every object in the image was recorded

Results
- Generated graphs that depict object counts on different days of the week
- Images that depict mask detection, distance, and human recognition

Future Work
- Analyze how social distancing affects infection rates in Urban areas
- Understand if enough people are complying to social distancing standards and if so, in what areas is this occurring in?
